Pediatric Nutrition Surveillance System (PedNSS) Summary 2004

Information on the health of a population is essential for assessing health needs and planning programs to address those needs. Surveillance is the process of measuring specific health indicators in a given population on a continuous basis, allowing for the evaluation of a population over time.

This report provides a summary of the nutritional data collected in South Dakota through the Pediatric Nutrition Surveillance System (PedNSS) for the calendar year of 2004. PedNSS is a program of the Centers for Disease Control and Prevention (CDC) and was started in 1973. The first year of statewide data collection for South Dakota was 1995. Currently, nearly all the states and territories participate in PedNSS.

The data was obtained by using the records of infants and children participating in the South Dakota Special Supplemental Nutrition Program for Women, Infants, and Children (WIC). Data is available by clinic, county, region and state. Cheyenne River, Rosebud Sioux and Standing Rock Tribal WIC Programs data are not included in this report.

Data is presented in this report for the state as a whole, by regions and by county for each of the six nutrition indicators:

- Birth weight

Low birth weight (less than 2,500 grams or 5.5 pounds) High birth weight (over 4,000 grams or 8.8 pounds)

- Short stature (low height-for-age)
- Underweight (low weight-for-height and low BMI-for-age)
- Overweight (high weight-for-height and high BMI-for-age)
- Anemia
- Breastfeeding

Ever breastfed
Breastfed at least 6 months
Breastfed at least 12 months

Individual clinics and counties with 100 or more individual children that could be analyzed are also reported separately. All clinics in a county are reported in county totals. All clinics statewide are reported in regional and state totals.

Data Collection and Reporting Changes

In 2004 the three Sioux Falls clinics; Downtown, Eastside and Westside, were consolidated into one. The Sioux Falls clinic data reflected in the tables of this report have been prorated to provide comparative three-year data.

Comparison of Data

PedNSS data can be collected in a variety of populations including WIC, Head Start, and Well Child Clinics (MCH). This report represents only infants and children participating in the WIC program of the South Dakota Department of Health. Care must be taken when comparing PedNSS data between states, as data is not always collected from identical populations. Care must also be taken when comparing the data in written reports before and after the recent PedNSS program changes in 2001. Data presented

in the main body of the report, including trend data, reflects the updated analysis of PedNSS.

In calendar year 2004, WIC served an average of 5,058 infants per month. This would indicate that approximately 45 percent of the total resident births, 11,339, in South Dakota were infants on WIC. The percentage of children varies greatly by county. All WIC participants are of limited income at or below 185 percent of the federal poverty level and have been determined to be at nutritional risk.

Limitations of Data

This is the eighth year that PedNSS data has been reported for South Dakota. Overall, the quality of the data is very good, but some sites may have more errors than others. Biologically Implausible Values (BIV) have a 1/1000 chance of being true data and are therefore considered to be an error. BIV's were not included in the data analysis.

The population of some counties is very small. All reported counties and clinics must have had at least 100 participants to have data analyzed. Only the total number of records analyzed and the percent of records with values that fell within the criteria were given for each indicator with at least 100 usable records. Data from counties and clinics with fewer than 100 records were not provided in this report as small numbers do not produce stable rates. The data used to compile this report consist of one unduplicated record per indicator per child.

When applicable, confidence intervals are given along with the rate of incidence for each county as well as for the state rate. This interval is based on the particular rate's standard error. The standard error defines a percentage's variability and is also used in calculating a confidence interval that can determine the actual variance of a percentage 95 percent of the time. That is, an interval in which a particular percentage will fall 95 percent of the time. The standard error takes into account the size of the sample being surveyed.

By applying the following formulas the standard error and the 95 percent confidence interval can be computed for the percent of respondents reporting each condition in the given period of time.

95 % Confidence Interval:

Percent ± (1.645 * Standard Error)

Standard Error

Percent / Square Root of the number of respondents reporting the condition (This produces an estimate of the standard error)

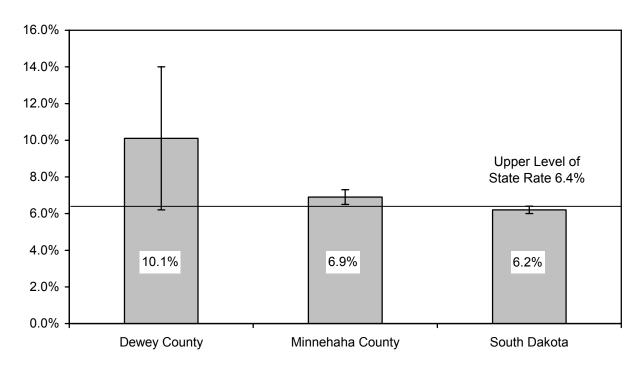

For example: the three-year PedNSS data, 2002-2004, indicates that 6.2 percent of the state's PedNSS children were short stature (low height-for-age) children. This was based on roughly 3,628 records (58,512 x .062) that indicated the children were short stature. An estimate of the standard error for the percent of short stature PedNSS children can be made by dividing the percent of children reported with short stature (6.2) by the square root of the number of short stature PedNSS children (Square Root of 3,628 \cong 60.2). This gives us an estimated standard error of 0.103 percent (6.2/60.2). Using the estimated standard error in the formula above the 95 percent confidence

interval for the percent of short stature PedNSS children in the state for the three-year period can be calculated. Following this formula, we compute the 95 percent confidence interval for the state's rate of short stature children to be from 6.0 to 6.4 percent (6.2 \pm 0.2).

Confidence intervals are useful where rates appear to be different, but the differences are not necessarily statistically significant. For example, in Dewey County there were 18 records of the 179 (179 x .101) analyzed that indicated the child was short stature for the three years 2002-2004. This gave a rate of 10.1 percent, which appears to be well above the state's rate of 6.2 percent. However, after computing the standard error, which takes into account the relatively few records in the county, we find that the 95 percent confidence interval is 3.9 percent. This makes the 95 percent confidence interval from 6.2 to 14.0 percent. Since the county interval overlaps the state's interval (6.0 to 6.4 percent), the differences are not statistically significant. On the other hand, compared to Dewey County, Minnehaha County had a lower rate, 6.9 percent, but since there were more records, 718 of the 10,403 (10,403 x .069) analyzed that indicated short stature children, the 95 percent confidence interval is smaller (0.4 percent). Since Minnehaha County's confidence interval (6.5 to 7.3 percent) does not overlap the state's interval, the difference is statistically significant. The data used in these examples are from Table 7, page 23.

The three-year data, provided in the tables, for the clinics, counties and regions that are significantly worse than the state wide values for that indicator are shaded to indicate these values are worse at the 0.05 level of confidence.

Using Confidence Intervals to Compare Data
Short Stature, 2002-2004 PedNSS Population

3

Demographic Data

A total of 32,710 records for 20,707 individual children are included in the 2004 analysis. This represents the total records submitted, including those records later rejected because of critical errors, missing data, biologically implausible values and duplicate entries for a given individual.

After these records were removed, there were:

- 5,044 unique records analyzed for low and high birth weight babies (biologically implausible values that were excluded from analysis were birth weights less than 250 grams and those greater than 6,000 grams);
- 20,133 records analyzed for short stature, underweight and overweight children;
- 14,470 records analyzed for low hemoglobin; and
- 5,116 records analyzed for ever breastfeeding,
- 3.014 for breastfed at least 6 months and
- 2.325 for breastfed at least 12 months.

The racial/ethnic composition of South Dakota's PedNSS population as compared to the composition of the state as a whole is shown in Table 1. The Summary of Indicators (Table 2) shows the number of visits and individuals served, age distribution, race/ethnicity, program composition, and prevalence of low/high and abnormal values. The risk of infant mortality and other pediatric health outcomes may vary between populations.

Table 1

Race/Ethnicity	2004 PedNSS Population	2000 SD Population (Census)*
White	68.1%	88.7%
Black	3.0%	0.8%
American Indian or Alaskan Native	27.6%	9.0%

Birth Weight

Low Birth Weight

The system allows for analysis of low and high birth weight. Low birth weight is defined as a birth weight below 2,500 grams (or 5.5 pounds) and is a strong indicator of an increased risk of neonatal mortality. For infants weighing 2,500 grams or less, mortality rates increase rapidly with decreasing birth weights.

The Healthy People 2010 Goal: Low birth rate of 5.0 percent or less.

The South Dakota PedNSS population had a low birth weight rate of 7.9 percent in 2004, down from 8.0 percent in 2003. The South Dakota PedNSS population had a low birth weight rate of 8.1 percent over the three-year period 2002-2004. The United States PedNSS population had a low birth weight rate of 9.1 percent in calendar year 2003.

Low birth weight is a nutrition indicator of the PedNSS system that is also collected by other means in this state. The South Dakota Department of Health, Office of Data, Statistics and Vital Records, collects birth weight information from birth certificates. Birth records for calendar year 2004 show that 6.9 percent of live births in South Dakota were low birth weight births.

- * < 2500 grams, among infants born during the reporting period.
- ** Reduce low birthweight to 5% of live births.

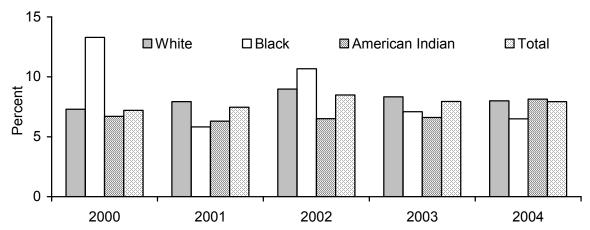

There are many risk factors that are known to potentially cause low birth weight and intrauterine growth retardation, although determining specific causes of low birth weight in segments of the population is difficult. Risk factors associated with low birth weight include: demographics (maternal age, marital status, ethnicity, education, and income), medical risks existing before pregnancy (weight status, obstetric history, parity and congenital anomalies), medical risks existing in current pregnancy (pregnancy induced hypertension, multiple pregnancy, poor weight gain), and environmental/behavioral factors (smoking, substance abuse, low socio-economic status, and poor nutrition).

Figure 3

South Dakota PedNSS

Trends in Prevalence of Low Birth Weight*

by Race

* < 2500 grams, among infants born during the reporting period.
 Year 2010 target: Reduce low birthweight to 5% of live births

The percentage of low birth weight varied by race in South Dakota's 2004 PedNSS population. The rates were:

- 8.0 percent for whites
- 6.5 percent for blacks
- 8.1 percent for American Indian and Alaskan Natives.

High Birth Weight

High birth weight is defined as a birth weight higher than 4,000 grams (or 8.8 pounds) and may also be called Large for Gestational Age (LGA). For infants weighing 4,000 grams or more, mortality rates are higher than for infants weighing between 3,000 and 4,000 grams (6.6 and 8.8 pounds).

Large for Gestational Age may be a result of maternal diabetes (which may or may not have been diagnosed before or during pregnancy) and may result in obesity in childhood that could extend into adult life. Very large infants have a higher incidence of birth injuries and congenital anomalies (especially heart disease) and developmental and intellectual retardation. When large for gestational age occurs with pre-term birth, the mortality risk is higher than when either exists alone.

The South Dakota PedNSS population had a high birth weight rate of 8.8 percent in 2004, down from 9.4 percent in 2003. The South Dakota PedNSS population had a high birth weight rate of 9.4 percent over the three-year period 2002-2004. The United States PedNSS population had a high birth weight rate of 7.3 percent in calendar year 2003.

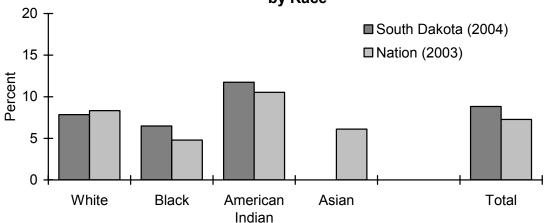

Birth records for calendar year 2004 show that 10.1 percent of live births in South Dakota were high birth weight births.

^{**} Counties by regions and regions by county conversion tables are in Appendix A and Appendix B.

Short Stature

Short stature is defined as a height-for-age below the 5th percentile for children of the same height and age in the reference populations used by the National Center for Health Statistics (NCHS) / CDC. Measurements of height are obtained by recumbent (lying down) measurement in children through 24 months and by upright measurement in children over 24 months.

Short stature may be evidence of compromised health, delayed development, and poor diet. Compromised nutrition, and/or infectious and chronic disease may impair full growth potential.

The Healthy People 2010 Goal: Target for Pediatric stunting: is to "reduce growth retardation among low-income children under 5 years of age to 5 percent.

The South Dakota rate of short stature among PedNSS records in 2004 was 6.4 percent, up from 6.1 percent in 2003. The South Dakota PedNSS population had a short stature rate of 6.2 percent over the three-year period 2002-2004. The United States PedNSS population had a short stature rate of 6.2 percent in calendar year 2003.

Figure 6 **South Dakota PedNSS** Prevalence of Short Stature* Among Children Aged <5 Years, by Race 15 ■ South Dakota (2004) 10 ■ Nation (2003) Year 2010 5 target** 0 White Total Black American Asian Indian

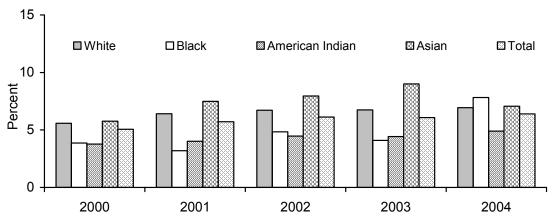

* < 5th percentile length or height-for-age, CDC Growth Charts, 2000.

^{**} Reduce growth retardation (short stature) among low-income children under age 5 years to 5%.

Figure 7

South Dakota PedNSS

Trends in Prevalence of Short Stature*
by Race

^{* &}lt; 5th percentile length or height-for-age, CDC Growth Charts, 2000. Year 2010 target: Reduce growth retardation (short stature) among low-income children under age 5 years to 5%.

The percentage of short stature varied by race in South Dakota's 2004 PedNSS population. The rates were:

- 6.9 percent for whites
- 7.8 percent for blacks,
- 4.9 percent for American Indians or Alaskan Natives
- 7.1 percent for Asian or Pacific Islander.

The age breakdown for this population was:

- less than one year, 9.7 percent
- one year, 5.2 percent
- 2-4 years, 3.9 percent

⁽³⁾ Low Height-For-Age: less than 5th percentile based on 2000 CDC growth chart percentiles for length-for-age for children under 2 years of age and height-for-age for children 2 years of age and older; excludes biologically implausible values for height, weight, and age

^{**} Counties by regions and regions by county conversion tables are in Appendix A and Appendix B.

<u>Underweight/Overweight (Children less than 5 years of age)</u>

Children, up to age 2 years and infants, falling below the 5th percentile in weight for height, compared to children of the same sex and age in the CDC reference population, are considered to be underweight. Children 2 years and older whose BMI-for-age falls below the 5th percentile are considered to be underweight. The conditions contributing to the higher percentage of low weight-for-height are inadequate dietary intake, failure to thrive, chronic and infectious diseases, and other normal variations within a population.

The percent prevalence of underweight infants and children was 3.1 percent in the South Dakota PedNSS data for 2004, down from 3.5 percent in 2003. The South Dakota PedNSS population had a low weight-for-height rate of 3.4 percent over the three-year period 2002-2004. The United States PedNSS population had a low weight-for-height rate of 5.2 percent in calendar year 2003.

* < 5th percentile weight-for-length or BMI-for-age, CDC Growth Charts, 2000.
 5% of children are expected to fall below the 5th percentile.

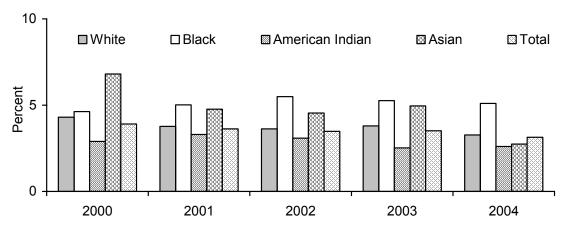

The percent prevalence of underweight children by race in South Dakota's 2004 PedNSS population was:

- 3.3 percent for whites
- 5.1 percent for blacks
- 2.6 for American Indians and Alaskan Natives
- 2.7 percent for Asian or Pacific Islanders

The age breakdown for this population was:

- less than one year, 3.8 percent
- one year, 2.9 percent
- 2-4 years of age, 2.6 percent

Figure 9
South Dakota PedNSS
Trends in Prevalence of Underweight*
by Race

 ^{* &}lt; 5th percentile weight-for-length or BMI-for-age, CDC Growth Charts, 2000.
 5% of children are expected to fall below the 5th percentile.

Children 2 years and older that have a BMI-for-age at or above the 95th percentile are considered to be overweight.

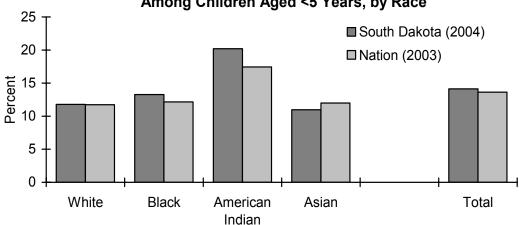

The percent prevalence of overweight children by race in South Dakota's 2004 PedNSS population was:

- 11.8 percent for whites
- 13.3 percent for blacks
- 20.2 for American Indians and Alaskan Natives
- 11.0 percent for Asian or Pacific Islanders

The age breakdown for this population was:

- less than one year, 11.7 percent
- one year, 20.0 percent
- 2-4 years of age, 13.9 percent

⁽⁵⁾ High Weight-For-Height: greater than or equal to 95th percentile based on 2000 CDC growth chart percentiles for weight-for-length for children under 2 years of age and BMI-for-age for children 2 years of age and older; excludes records with biologically implausible values for height, age, and weight.

^{**} Counties by regions and regions by county conversion tables are in Appendix A and Appendix B.

Overweight and At Risk of Overweight (2 to 5 years of age)

Children 2 years and older that have a BMI-for-age at or above the 95th percentile in the CDC's reference population of children matched for age, height, and sex are defined as overweight. Children 2 years and older whose BMI-for-age is between the 85th percentile but below the 95th percentile are defined as "At risk of overweight".

Obesity is defined as an excessive deposit of adipose tissue. A measure of weight-for-height above the 95th percentile does not measure fat tissue; it indicates but does not define obesity.

Obesity is a risk factor for the following conditions in adulthood: cardiovascular disease, hypertension, diabetes, degenerative joint disease, and psychological problems. Studies show that 26 percent of overweight children (BMI above 95th percentile) 1-3 years will be obese at age 25 and 52 percent of overweight children 3 to 6 years will be obese at age 25. Whitaker et al. NEJM:1997;337:869-873.

South Dakota PedNSS Prevalence of Overweight and at Risk of Overweight* Among Children Aged 2 to <5 Years, by Race 25 ☐ Risk of overweight ■ Overweight 20 15 10 5 0 White SD (2004) **Black** American Asian US (2003) Indian

Figure 12

* Overweight: > 95th percentile weight-for-length or BMI-for-age; at risk of overweight: > 85th-<95th percentile weight-for-length or BMI-for-age, CDC Growth Charts, 2000. 15% of children are expected to fall above the 85th percentile (5% above the 95th percentile and 10% between the 85th and 95th percentiles).

Healthy People 2010 Goal: There are no Healthy People 2010 goals for overweight preschool children. The Healthy People 2010 target for the reduction of overweight or obese children age 6 to 11 is 5 percent.

The 2004 rate of overweight, ages 2 to 5 years, in South Dakota's PedNSS records was 13.9 percent, up from 13.6 percent in 2003. The South Dakota PedNSS population rate for overweight children was 13.4 percent for the three-year period 2002-2004. The United States PedNSS population rate for overweight children was 14.7 percent in calendar year 2003.

The percent prevalence of overweight (greater than or equal to 95th percentile) and at risk of overweight (85th to 95th percentile) children by race/ethnicity and age are as follows:

Race/Ethnicity	At Risk of Overweight	Overweight		
	(85th to 95th	(≥95th percentile)		
	percentile)			
White	16.6	12.0		
Black	15.2	13.2		
American Indian/Alaska Native	21.5	18.3		
Age				
2 years	18.3	13.3		
3 years	17.9	14.9		
4 years	18.0	13.4

** Counties by regions and regions by county conversion tables are in Appendix A and Appendix B.

Anemia

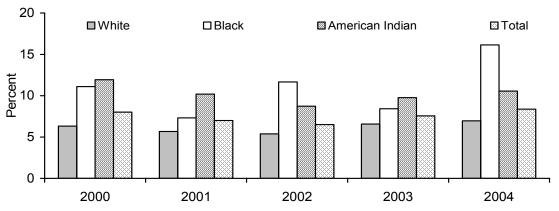

Anemia is defined as having low hemoglobin (Hb) concentrations or hematocrit (Hct) values when measuring a healthy reference population of the same age. The PedNSS uses a hemoglobin and/or hematocrit value below the 5th percentile of the third National Health and Nutrition Examination Survey (NHANES III) reference population.

The percent prevalence in South Dakota's PedNSS population with anemia was 8.4 percent in 2004, up from 7.6 percent in 2003. The percent of the South Dakota PedNSS population with anemia was 7.5 percent over the three-year period 2002-2004. The United States PedNSS population had an anemia rate of 12.8 percent in calendar year 2003.

Figure 13 **South Dakota PedNSS** Prevalence of Anemia* Among Children Aged <5 Years, by Race 20 ■ South Dakota (2004) ■ Nation (2003) 15 10 5 0 White Black American Asian Total Indian

* Hb or Hct < 5th percentile, CDC MMWR vol. 47 (No. RR-3), 1998.

^{*} Hb or Hct < 5th percentile, CDC MMWR vol. 47 (No. RR-3), 1998.

The Healthy People 2010 Goal: Target for reducing iron deficiency among children ages 1-2 is 5 percent and children ages 3-4 is one percent.

The percent prevalence of children with anemia by race in South Dakota's 2004 PedNSS population was:

- 7.0 percent for whites
- 16.1 percent for blacks
- 10.6 percent for American Indians or Alaskan Natives
- 16.8 percent for Asian or Pacific Islanders.

The age breakdown for this population was:

- less than 12 months, 11.5 percent;
- 12 through 17 months, 10.7 percent;
- 18 through 23 months, 8.4 percent;
- 24 through 35 months, 9.0 percent;
- 36 through 59 months, 4.7.

When converted to whole years the age breakdown for this population was:

- less than one year, 11.5 percent
- 1 year, 9.5 percent
- 2 years, 9.0 percent
- 3 years, 5.3 percent
- 4 years of age, 3.9 percent

Breastfeeding

Initiation

Healthy People 2010 Goal: Is to increase the proportion of mothers who breastfeed their babies in the early postpartum period to at least 75 percent, 50 percent at 6 months and at least 25 percent at one year.

According to the 2004 PedNSS population in SD, 56.8 percent of children 2 years of age and under were ever breastfed. This is an increase from the 2003 rate of 55.98 percent. The three-year rate for 2002 through 2004 PedNSS population was 54.4 percent. The United States rate for the PedNSS population that had ever breastfed was 53.2 percent in calendar year 2003.

Figure 15 **South Dakota PedNSS** Percentage of Infants Ever Breastfed* by Race 100 ■ South Dakota (2004) 90 Year ■ Nation (2003) 80 2010 70 target** 60 50 40 30 20 10 White Black Asian Total American Indian

* Among infants born during the reporting period.

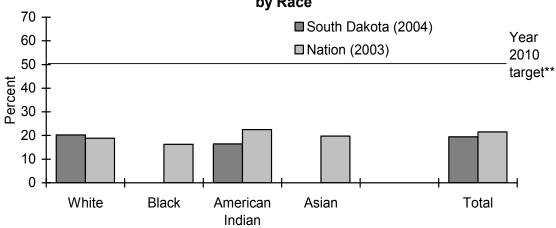

The South Dakota PedNSS populations by race in 2004 who ever breastfed was:

- 59.4 percent for whites
- 60.9 percent for blacks
- 48.7 percent for American Indian.

^{**} Increase the proportion of mothers who breastfeed their babies in the early postpartum period to 75%.

Six Months or More

Figure 16
South Dakota PedNSS
Percentage of Infants Breastfed at Least 6 Months*
by Race

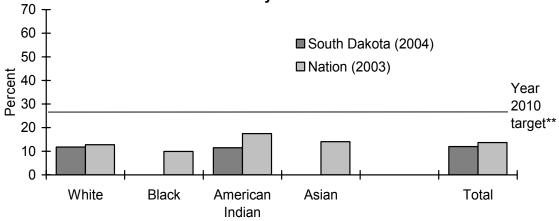

- * Among infants who turned 6 months of age during the reporting period.
- ** Year 2010 target: increase the proportion of mothers who breastfeed their babies at 6 months to 50%.

Figure 17

South Dakota PedNSS

Percentage of Infants Breastfed at Least 12 Months*

by Race

- * Among infants who turned 12 months of age during the reporting period.
- ** Increase the proportion of mothers who breastfeed their babies at 1 year to 25%.

The percent of infants in the South Dakota PedNSS population that were breastfed at least 6 months in 2004 was 19.4 percent. This is a decrease from the 2003 rate of 22.0 percent. The three-year rate for the 2002 through 2004 PedNSS population was 18.4. In the United States PedNSS population, the percent of infants that were breastfed at least 6 months was 21.5 percent in calendar year 2003.

The percent of South Dakota PedNSS infant's breastfed at least 6 months by race or ethnicity in 2004 was:

- 20.2 percent for whites
- 16.5 percent for American Indians and Alaskan Natives.

The percent of infants in the South Dakota PedNSS population that were breastfed at least 12 months in 2004 was 12.0 percent. This is a decrease from the 2003 rate of 13.1 percent. The three-year rate for the 2002 through 2004 PedNSS population was 10.5. In the United States PedNSS population the percent of infants that were breastfed at least 12 months was 13.6 percent in calendar year 2003.

The percent of South Dakota PedNSS infant's breastfed at least 12 months by race or ethnicity in 2004 was:

- 11.8 percent for whites
- 11.5 percent for American Indians and Alaskan Natives.
